

CLOSURE PLAN CONTENTS AND TECHNICAL REVIEW

3.10 - GROUNDWATER SAMPLING

Normally there is no reason a treatment/storage facility, that is planning to clean close, will need to include a description of groundwater sampling in their closure plan. There is no reason to require groundwater monitoring from a facility if it has not been proven yet that contaminants have been released from a regulated unit or that they have migrated through the soil to groundwater levels.

However, after closure implementation it is determined that there is contaminated soil and the facility decides that the contaminated soils will remain in place and be capped, then the facility must be closed as a landfill. The maintenance of the cap and groundwater remediation and monitoring would require post-closure regulatory requirements. The permit writer is advised to consult with his/her supervisor for further guidance in this situation.
